Newton's Laws of Motion

Introduction

Newton's Laws of Motion are a set of laws that describe the motion of objects in physics. They were first proposed in 1687 by Newton, who summarized them based on the experiments and principles developed by his predecessors to explain the relationship between force and the motion of objects. Newton's three laws of motion are the First Law of Motion, the Second Law of Motion, and the Third Law of Motion, which can also be referred to as the Law of Inertia, the Law of Acceleration, and the Law of Action and Reaction, respectively.

Newton's First Law of Motion	(Law of Inertia)
------------------------------	------------------

rtonton o'i not zan o'i motion (zan o'i mortia)
Newton's First Law describes that, when an object is not subjected to any force, it tends to
maintain its original state of motion, that is, when an object is at rest, if it is not subjected to any
force, it will remain at rest. If an object is in motion, if it is not subjected to any force, it will
maintain uniform linear motion, which can also be referred to as the Law of Inertia.

Sample Problem #1

When an object with a mass of $m=10~{\rm kg}$ is subjected to a force, and the object is accelerated to a velocity of $v_1=20~{\rm m/s}$. If the force is removed, what is the velocity of the object at this time? What is the velocity of the object 3 seconds later?

Sol.		

Newton's Second Law of Motion (Law of Acceleration)

Newton's Second Law, also known as the Law of Acceleration, describes that when an object is subjected to a force and the sum of the forces is greater than zero, the force will give the object an acceleration, the magnitude of which will be related to the size of the sum of the forces and the mass in the following relationship:

$$ec{F}=mec{a}$$
 (1)

Unit of Force

Based on the above formula, it's not hard to find that the unit of force can be written as the product of the units of mass and acceleration. Its dimensions are $[M][L][T]^{-2}$, in SI Units, it can be written as $kg \cdot m \cdot s^{-2}$. We can also simplify the unit of force to N (we call it Newton), and the relationship between Newton and the basic unit is $1N = 1kg \cdot m \cdot s^{-2}$.

Sample Problem #2

Now there is an object with a mass of $2\mathrm{kg}$, which is subjected to a rightward pushing force $F_1=10\mathrm{N}$ and a leftward pulling force $F_2=5\mathrm{N}$ on a plane, please draw the force diagram of the object and answer the following questions: (a) What is the net force on the object? (b) What is the acceleration produced by the two forces on the object? (c) In addition, the initial velocity of the object is to the left $v_0=10\mathrm{m/s}$, at $t=2\mathrm{s}$, what is the velocity of the object? (d) Following the previous question, what is the displacement Δx of the object from $t=0\mathrm{s}$ to $t=4\mathrm{s}$?

Sample Problem #3	Samp	le P	rob	lem	#3
-------------------	------	------	-----	-----	----

- (a) If the relationship between the position over time of an object with mass m is x=3t, what is the net force on the object?
- (b) If the relationship between the velocity over time of the object with mass m is $x=-6t^2+2t+4$, what is the net force on the object?

Sol.		

Sample Problem #4

Now there is a particle with a mass of m passing through a parallel plate with a length of L, its velocity is accelerated from v_0 to v_1 , if the force on the particle in the parallel plate is a constant, what is the force? What is the acceleration produced by the force?

orces that the two	of Motion describes that when two objects interact with each other, the ojects give to each other will be equal in magnitude and opposite in also be referred to as the Law of Action and Reaction.
Sample Pro	lem #5
elocity of the ball of 0.1 seconds, plead is constant, wh	all with a mass of $200~{ m g}$, which is hit by a bat. During the swing, the anges from $v_0=-40~{ m m/s}$ to $v_1=30~{ m m/s}$. If the duration of the swine answer the following questions: (a) If the force exerted by the bat on the is the magnitude of this force? (b) Following the previous question, howeverted by the ball on the bat?
elocity of the ball of 0.1 seconds, pleall is constant, wh	anges from $v_0=-40~\mathrm{m/s}$ to $v_1=30~\mathrm{m/s}$. If the duration of the swine answer the following questions: (a) If the force exerted by the bat on the street that the magnitude of this force? (b) Following the previous question, how
elocity of the ball of 0.1 seconds, pleal is constant, who nuch is the force e	anges from $v_0=-40~\mathrm{m/s}$ to $v_1=30~\mathrm{m/s}$. If the duration of the swine answer the following questions: (a) If the force exerted by the bat on the street that the magnitude of this force? (b) Following the previous question, how
elocity of the ball of 0.1 seconds, pleal is constant, who nuch is the force e	anges from $v_0=-40~\mathrm{m/s}$ to $v_1=30~\mathrm{m/s}$.
